

WordPress: come rendere relativi gli URL dell'installazione

Possiamo rendere gli URL di WordPress relativi con molta semplicità.

La soluzione è la seguente.

```
add_action( 'template_redirect', 'my_relative_url' );

function my_relative_url() {
    $filters = array(

        // Post e categorie

        'bloginfo_url',
        'the_permalink',
        'wp_list_pages',
        'wp_list_categories',
        'the_content_more_link',
        'the_tags',
        'the_author_posts_link',
        'post_link',
        'post_type_link',
        'page_link',
        'attachment_link',
        'get_shortlink',
        'post_type_archive_link',
        'get_pagenum_link',
        'get_comments_pagenum_link',
        'term_link',
        'search_link',
```

```
'day_link',
'month_link',
'year_link',

// URL dell'installazione
'option_siteurl',
'blog_option_siteurl',
'option_home',
'admin_url',
'get_admin_url',
'get_site_url',
'network_admin_url',
'home_url',
'includes_url',
'site_url',
'site_option_siteurl',
'network_home_url',
'network_site_url',

// Debug
'get_the_author_url',
'get_comment_link',
'wp_get_attachment_image_src',
'wp_get_attachment_thumb_url',
'wp_get_attachment_url',
'wp_login_url',
'wp_logout_url',
'wp_lostpassword_url',
'get_stylesheet_uri',
'get_stylesheet_directory_uri',
'plugins_url',
'plugin_dir_url',
'stylesheet_directory_uri',
'get_template_directory_uri',
```

```
'template_directory_uri',
'get_locale_stylesheet_uri',
'script_loader_src',
'style_loader_src',
'get_theme_root_uri'
);

$home_url = home_url();

$filter_fn = function( $link ) use ( $home_url ) {
    if ( !is_array( $link ) && strpos( $link,
$home_url ) === 0 ) {
        return wp_make_link_relative( $link );
    } else {
        return $link;
    }
};

foreach ( $filters as $filter ) {
    add_filter( $filter, $filter_fn );
}
}
```
